Lab 11

Lab10 cont’d

Today's plan

01 **Websites with MyST (mini-demo)** It works now!

03 **Intro to today’s mission**

04 **Reading Checkpoint**

05 **Work together!**

Websites with MyST (mini-demo)

1. Build widget in DataHub now works (let's test it on last week's lab)
2. Let's test `myst build --pdf`
   a. We have to add a markdown cell at the beginning of the notebook, formatted as yaml containing the format and output path. E.g.

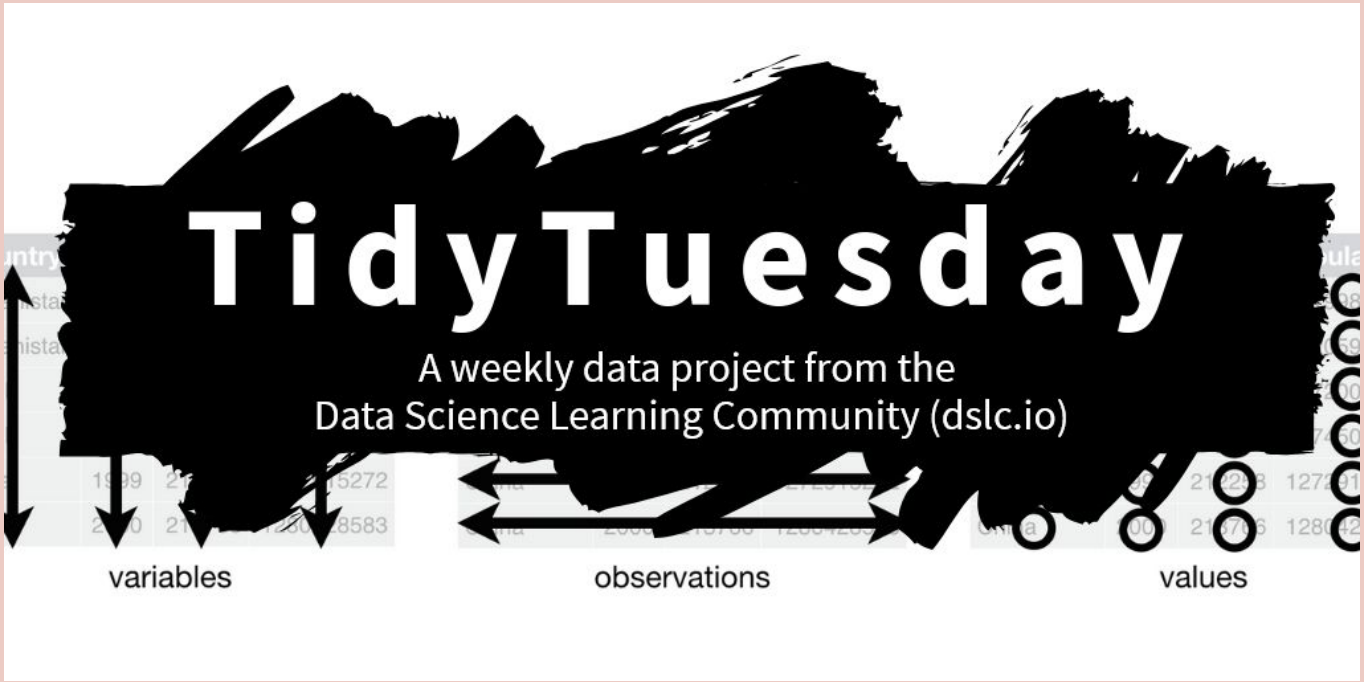

```
---
title: "Estimating π by Throwing Darts"
authors:
  - name: "Jane Doe"
    affiliation: "UC Berkeley"
exports:
  - format: pdf
    template: arxiv_two_column
    output: exports/paper.pdf
---
```

   b. Type `myst build --pdf`, in the terminal
   c. Also, let's rebuild the website with the widget

For today

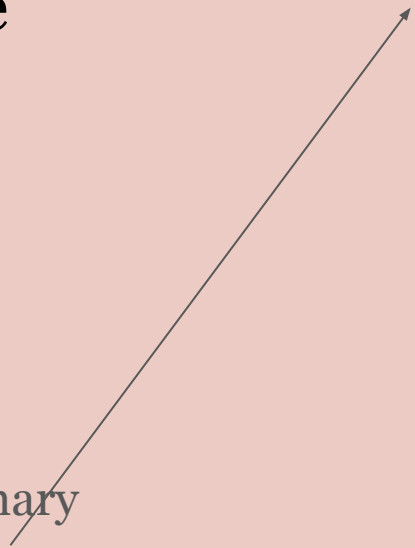

TidyTuesday

https://github.com/rfordatascience/tidytuesday

Repo structure

year/
- yy-mm-dd/
  - .
  - .
  - .
  - yy-mm-dd/
    - data
    - scripts
    - data dictionary
    - README

Readme

Contains explanation of dataset; some questions to answer from the data; code to download and clean the data; data dictionary

The idea

Part I

1. You will work in pairs
2. Go to TidyTuesday's repo https://github.com/rfordatascience/tidytuesday
3. Choose one data set from 2026 and setup a repo in one of the teammate's github account (~10 mins)

Part II

4. Each member of the team chooses one question from the README to solve (if you finish fast, you could do more)
5. Together create a myst website
6. Together create a Github Action to deploy that website into Github Pages (try doing `myst init --gh-pages`)
7. Together create a few slides using RevealJS (look at the Week 12, Nov 9th lecture slides). Keep in mind that you will pitch your data and analysis
8. Get together with *another team*, and present your work (show your website!)

*Bonus: Add a Binder badge to your repo's README

Part I
Choose your partner, choose one dataset from 2026 and setup a repo in one of the teammate's github account

https://github.com/rfordatascience/tidytuesday

(~10 mins)

Reading Checkpoint

You'll return it until the end of class

Part II

1. Each member of the team chooses one question from the README to solve (if you finish fast, you could do more) (~45 mins)
2. Create a myst website (~5 mins)
3. Create a Github Action to deploy that website into Github Pages (try doing `myst init --gh-pages`) (~10 mins)
4. Create a few slides using RevealJS (look at the Week 12, Nov 9th lecture slides), to pitch your data and analysis (~15 mins)
5. Get together with another team, and pitch your work (show your website!) (~10 mins -> 5 mins per team)
